School of Linguistic, Speech and Communication Sciences
Trinity College Dublin

Semester 2 2026

Roadmap

Today

- **Phenomenon:** NPs encode different ways of individuating: **count** (bounded atoms), **mass** (no privileged atoms), and **plural** (built from atoms but mass-like in key respects).

Today

- **Phenomenon:** NPs encode different ways of individuating: **count** (bounded atoms), **mass** (no privileged atoms), and **plural** (built from atoms but mass-like in key respects).
- **Formal tools:** part-whole structure (mereology/lattices), **join/meet** ($\sqcup, \sqcap$), and sum formation (+).

Today

- **Phenomenon:** NPs encode different ways of individuating: **count** (bounded atoms), **mass** (no privileged atoms), and **plural** (built from atoms but mass-like in key respects).
- **Formal tools:** part-whole structure (mereology/lattices), **join/meet** ($\sqcup, \sqcap$), and sum formation (+).
- **Cross-linguistic comparison:** languages differ in where they realise individuation (plural morphology vs classifiers vs measure words), but the semantic ingredients are stable.

The empirical contrast

The empirical contrast

Count vs mass

- **Count nouns**

Count vs mass

- **Count nouns**
 - combine with numerals: *three rings*

Count vs mass

- **Count nouns**

- combine with numerals: *three rings*
- combine with *a/an*: *a ring*

Count vs mass

- **Count nouns**

- combine with numerals: *three rings*
- combine with *a/an*: *a ring*
- pluralise: *ring/rings*

Count vs mass

- **Count nouns**

- combine with numerals: *three rings*
- combine with *a/an*: *a ring*
- pluralise: *ring/rings*

- **Mass nouns**

Count vs mass

- **Count nouns**

- combine with numerals: *three rings*
- combine with *a/an*: *a ring*
- pluralise: *ring/rings*

- **Mass nouns**

- combine with *much/little*: *much water, a little wine*

Count vs mass

- **Count nouns**

- combine with numerals: *three rings*
- combine with *a/an*: *a ring*
- pluralise: *ring/rings*

- **Mass nouns**

- combine with *much/little*: *much water, a little wine*
- resist numerals without measures/packaging: **three water*

Count vs mass

- **Count nouns**

- combine with numerals: *three rings*
- combine with *a/an*: *a ring*
- pluralise: *ring/rings*

- **Mass nouns**

- combine with *much/little*: *much water, a little wine*
- resist numerals without measures/packaging: **three water*
- typically do not pluralise in the same way: *water/*waters* (unless shifted)

Count vs mass

- **Count nouns**

- combine with numerals: *three rings*
- combine with *a/an*: *a ring*
- pluralise: *ring/rings*

- **Mass nouns**

- combine with *much/little*: *much water, a little wine*
- resist numerals without measures/packaging: **three water*
- typically do not pluralise in the same way: *water/*waters* (unless shifted)

Plural

- Plurals are built from count atoms (*horses* from *horse*).

Plural

- Plurals are built from count atoms (*horses* from *horse*).
- But plurals pattern with mass in many environments:

Plural

- Plurals are built from count atoms (*horses* from *horse*).
- But plurals pattern with mass in many environments:
 - *a lot of horses* / *a lot of water*

Plural

- Plurals are built from count atoms (*horses* from *horse*).
- But plurals pattern with mass in many environments:
 - *a lot of horses* / *a lot of water*
 - *more horses* / *more water*

Plural

- Plurals are built from count atoms (*horses* from *horse*).
- But plurals pattern with mass in many environments:
 - *a lot of horses* / *a lot of water*
 - *more horses* / *more water*
 - *enough horses* / *enough water*

Plural

- Plurals are built from count atoms (*horses* from *horse*).
- But plurals pattern with mass in many environments:
 - *a lot of horses* / *a lot of water*
 - *more horses* / *more water*
 - *enough horses* / *enough water*
- We want a semantics that captures both:

Number and agreement

- One way singulars and plurals can be distinguished is agreement on the verb.

Number and agreement

- One way singulars and plurals can be distinguished is agreement on the verb.
- English usually shows this clearly:

Number and agreement

- One way singulars and plurals can be distinguished is agreement on the verb.
- English usually shows this clearly:
 - *The horse is in the field.*

Number and agreement

- One way singulars and plurals can be distinguished is agreement on the verb.
- English usually shows this clearly:
 - *The horse is in the field.*
 - *The horses are in the field.*

Number and agreement

- One way singulars and plurals can be distinguished is agreement on the verb.
- English usually shows this clearly:
 - *The horse is in the field.*
 - *The horses are in the field.*
- Some nouns behave differently: collective nouns.

Number and agreement

- One way singulars and plurals can be distinguished is agreement on the verb.
- English usually shows this clearly:
 - *The horse is in the field.*
 - *The horses are in the field.*
- Some nouns behave differently: collective nouns.
 - American English typically prefers singular agreement:

 - count vs mass lexical semantics,

Where do counting units come from?

- Numerals require **units**. Languages differ in how they make units available.
- English tends to encode unithood via:
 - count vs mass lexical semantics,
 - plural morphology,

Where do counting units come from?

- Numerals require **units**. Languages differ in how they make units available.
- English tends to encode unithood via:
 - count vs mass lexical semantics,
 - plural morphology,
 - measure phrases (*three glasses of water*).

Where do counting units come from?

- Numerals require **units**. Languages differ in how they make units available.
- English tends to encode unithood via:
 - count vs mass lexical semantics,
 - plural morphology,
 - measure phrases (*three glasses of water*).
- Other languages make the unit contribution more overt (classifiers, measure words).

Where do counting units come from?

- Numerals require **units**. Languages differ in how they make units available.
- English tends to encode unithood via:
 - count vs mass lexical semantics,
 - plural morphology,
 - measure phrases (*three glasses of water*).
- Other languages make the unit contribution more overt (classifiers, measure words).

Classifier languages

- In many classifier languages, a numeral combines with a **classifier** that supplies a counting unit.

Classifier languages

- In many classifier languages, a numeral combines with a **classifier** that supplies a counting unit.
- Mandarin (pinyin):

Classifier languages

- In many classifier languages, a numeral combines with a **classifier** that supplies a counting unit.
- Mandarin (pinyin):
sān zhī gǒu
three CL dog
'three dogs'

Classifier languages

- In many classifier languages, a numeral combines with a **classifier** that supplies a counting unit.
- Mandarin (pinyin):
sān zhī gǒu
three CL dog
'three dogs'
- The noun itself can be comparatively number-neutral; the classifier does the unit work.

Classifier languages

- In many classifier languages, a numeral combines with a **classifier** that supplies a counting unit.
- Mandarin (pinyin):
sān zhī gǒu
three CL dog
'three dogs'
- The noun itself can be comparatively number-neutral; the classifier does the unit work.

Plural marking varies with numerals

- Some languages resist plural morphology in the presence of numerals.

Plural marking varies with numerals

- Some languages resist plural morphology in the presence of numerals.
- Turkish (often discussed pattern):

Plural marking varies with numerals

- Some languages resist plural morphology in the presence of numerals.
- Turkish (often discussed pattern):

üç kitap

three book

'three books'

Plural marking varies with numerals

- Some languages resist plural morphology in the presence of numerals.
- Turkish (often discussed pattern):
 - üç kitap*
 - three book*
 - 'three books'*
- The unit contribution is still there, but it need not be realised by plural morphology.

Plural marking varies with numerals

- Some languages resist plural morphology in the presence of numerals.
- Turkish (often discussed pattern):
 - üç kitap*
 - three book*
 - 'three books'*
- The unit contribution is still there, but it need not be realised by plural morphology.

Measure words vs classifiers

- Even in English, mass counting typically goes through a measure/unit expression:

Measure words vs classifiers

- Even in English, mass counting typically goes through a measure/unit expression:
 - *three glasses/bottles of water*

Measure words vs classifiers

- Even in English, mass counting typically goes through a measure/unit expression:
 - *three glasses/bottles of water*
- In classifier languages, the distinction between **classifiers** and **measure words** can track the same semantic split:

Measure words vs classifiers

- Even in English, mass counting typically goes through a measure/unit expression:
 - *three glasses/bottles of water*
- In classifier languages, the distinction between **classifiers** and **measure words** can track the same semantic split:
 - classifier: counts discrete units

Measure words vs classifiers

- Even in English, mass counting typically goes through a measure/unit expression:
 - *three glasses/bottles of water*
- In classifier languages, the distinction between **classifiers** and **measure words** can track the same semantic split:
 - classifier: counts discrete units
 - measure: counts amounts (cup, kilo, litre, etc.)

Measure words vs classifiers

- Even in English, mass counting typically goes through a measure/unit expression:
 - *three glasses/bottles of water*
- In classifier languages, the distinction between **classifiers** and **measure words** can track the same semantic split:
 - classifier: counts discrete units
 - measure: counts amounts (cup, kilo, litre, etc.)

Beyond spoken language: sign languages

- The mass/count contrast is not tied to the speech modality.

Beyond spoken language: sign languages

- The mass/count contrast is not tied to the speech modality.
- Work in formal semantics of sign languages argues that analogous distinctions show up cross-modally, including how classifier-like resources encode unithood and individuation.

Beyond spoken language: sign languages

- The mass/count contrast is not tied to the speech modality.
- Work in formal semantics of sign languages argues that analogous distinctions show up cross-modally, including how classifier-like resources encode unithood and individuation.
- Moral: the **semantic architecture** (atoms, sums, parts, units) is stable even when the **morphophonology** is very different.

Beyond spoken language: sign languages

- The mass/count contrast is not tied to the speech modality.

Orders, lattices, and Hasse diagrams

From an order $\leq$ to a lattice

- Start with an explicitly mathematical relation $\leq$.

From an order $\leq$ to a lattice

- Start with an explicitly mathematical relation $\leq$.
- A relation $\leq$ is a **partial order** if it is:

From an order $\leq$ to a lattice

- Start with an explicitly mathematical relation $\leq$.
- A relation $\leq$ is a **partial order** if it is:
 - **Reflexive:** $x \leq x$

From an order $\leq$ to a lattice

- Start with an explicitly mathematical relation $\leq$.
- A relation $\leq$ is a **partial order** if it is:
 - **Reflexive:** $x \leq x$
 - **Antisymmetric:** if $x \leq y$ and $y \leq x$, then $x = y$

From an order $\leq$ to a lattice

- Start with an explicitly mathematical relation $\leq$.
- A relation $\leq$ is a **partial order** if it is:
 - **Reflexive:** $x \leq x$
 - **Antisymmetric:** if $x \leq y$ and $y \leq x$, then $x = y$
 - **Transitive:** if $x \leq y$ and $y \leq z$, then $x \leq z$

From an order $\leq$ to a lattice

- Start with an explicitly mathematical relation $\leq$.
- A relation $\leq$ is a **partial order** if it is:
 - **Reflexive:** $x \leq x$
 - **Antisymmetric:** if $x \leq y$ and $y \leq x$, then $x = y$
 - **Transitive:** if $x \leq y$ and $y \leq z$, then $x \leq z$
- A **lattice** is a poset where every pair has a **join** ($\sqcup$) and a **meet** ($\sqcap$).

From an order $\leq$ to a lattice

- Start with an explicitly mathematical relation $\leq$.
- A relation $\leq$ is a **partial order** if it is:
 - **Reflexive:** $x \leq x$
 - **Antisymmetric:** if $x \leq y$ and $y \leq x$, then $x = y$
 - **Transitive:** if $x \leq y$ and $y \leq z$, then $x \leq z$
- A **lattice** is a poset where every pair has a **join** ($\sqcup$) and a **meet** ($\sqcap$).

A Hasse diagram: $\{1, 2, 3, 4\}$ under $\leq$

A Hasse diagram: $\{1, 2, 3, 4\}$ under $\leq$

- $a \leq b$ is the standard numerical order.

A Hasse diagram: $\{1, 2, 3, 4\}$ under $\leq$

- $a \leq b$ is the standard numerical order.
- Here, $x \sqcup y = \max(x, y)$ and $x \sqcap y = \min(x, y)$.

A Hasse diagram: $\{1, 2, 3, 4\}$ under $\leq$

- $a \leq b$ is the standard numerical order.
- Here, $x \sqcup y = \max(x, y)$ and $x \sqcap y = \min(x, y)$.

Numbers go up without end

Numbers go up without end

Numbers go up without end

Positive integers ordered by divisibility

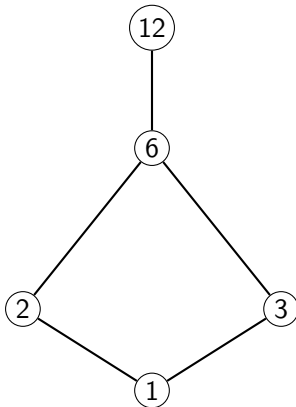

- Define an order $|$ on positive integers: $x | y$ iff x divides y .

Positive integers ordered by divisibility

- Define an order $|$ on positive integers: $x | y$ iff x divides y .
- In this order, the meet is $\gcd(x, y)$ and the join is $\text{lcm}(x, y)$.

Positive integers ordered by divisibility

- Define an order $|$ on positive integers: $x | y$ iff x divides y .
- In this order, the meet is $\gcd(x, y)$ and the join is $\text{lcm}(x, y)$.

Meet and join

- In a poset $(X, \leq)$:

Meet and join

- In a poset $(X, \leq)$:
 - the **meet** of x and y (written $x \sqcap y$) is their **greatest lower bound**,

Meet and join

- In a poset $(X, \leq)$:
 - the **meet** of x and y (written $x \sqcap y$) is their **greatest lower bound**,
 - the **join** of x and y (written $x \sqcup y$) is their **least upper bound**.

Meet and join

- In a poset $(X, \leq)$:
 - the **meet** of x and y (written $x \sqcap y$) is their **greatest lower bound**,
 - the **join** of x and y (written $x \sqcup y$) is their **least upper bound**.
- Intuition: $\sqcap$ behaves like intersection, $\sqcup$ behaves like union.

Meet and join

- In a poset $(X, \leq)$:
 - the **meet** of x and y (written $x \sqcap y$) is their **greatest lower bound**,
 - the **join** of x and y (written $x \sqcup y$) is their **least upper bound**.
- Intuition: $\sqcap$ behaves like intersection, $\sqcup$ behaves like union.
- In our mereological application, we will usually write the join/sum as $+$: $x + y$.

Meet and join

- In a poset $(X, \leq)$:
 - the **meet** of x and y (written $x \sqcap y$) is their **greatest lower bound**,
 - the **join** of x and y (written $x \sqcup y$) is their **least upper bound**.
- Intuition: $\sqcap$ behaves like intersection, $\sqcup$ behaves like union.
- In our mereological application, we will usually write the join/sum as $+$: $x + y$.

Semilattices and induced order

- A join-semilattice is a structure $(S, \sqcup)$ where $\sqcup$ is:

Semilattices and induced order

- A join-semilattice is a structure $(S, \sqcup)$ where $\sqcup$ is:
 - **associative:** $(x \sqcup y) \sqcup z = x \sqcup (y \sqcup z)$

Semilattices and induced order

- A join-semilattice is a structure $(S, \sqcup)$ where $\sqcup$ is:
 - **associative:** $(x \sqcup y) \sqcup z = x \sqcup (y \sqcup z)$
 - **commutative:** $x \sqcup y = y \sqcup x$

Semilattices and induced order

- A join-semilattice is a structure $(S, \sqcup)$ where $\sqcup$ is:
 - **associative:** $(x \sqcup y) \sqcup z = x \sqcup (y \sqcup z)$
 - **commutative:** $x \sqcup y = y \sqcup x$
 - **idempotent:** $x \sqcup x = x$

Semilattices and induced order

- A join-semilattice is a structure $(S, \sqcup)$ where $\sqcup$ is:
 - **associative:** $(x \sqcup y) \sqcup z = x \sqcup (y \sqcup z)$
 - **commutative:** $x \sqcup y = y \sqcup x$
 - **idempotent:** $x \sqcup x = x$
- This operation induces an order: $x \leq y$ iff $x \sqcup y = y$.

Semilattices and induced order

- A join-semilattice is a structure $(S, \sqcup)$ where $\sqcup$ is:
 - **associative:** $(x \sqcup y) \sqcup z = x \sqcup (y \sqcup z)$
 - **commutative:** $x \sqcup y = y \sqcup x$
 - **idempotent:** $x \sqcup x = x$
- This operation induces an order: $x \leq y$ iff $x \sqcup y = y$.

A concrete order: height

- Let $S = \{\text{Tom, Andy Murray, LeBron James}\}$.

A concrete order: height

- Let $S = \{\text{Tom, Andy Murray, LeBron James}\}$.
- Assume heights are strictly ordered:

A concrete order: height

- Let $S = \{\text{Tom}, \text{Andy Murray}, \text{LeBron James}\}$.
- Assume heights are strictly ordered:

$$h(\text{Tom}) < h(\text{Andy}) < h(\text{LeBron}).$$

A concrete order: height

- Let $S = \{\text{Tom}, \text{Andy Murray}, \text{LeBron James}\}$.
- Assume heights are strictly ordered:

$$h(\text{Tom}) < h(\text{Andy}) < h(\text{LeBron}).$$

- Define an order $\preceq$ by: $x \preceq y$ iff $h(x) \leq h(y)$.

A concrete order: height

- Let $S = \{\text{Tom}, \text{Andy Murray}, \text{LeBron James}\}$.
- Assume heights are strictly ordered:

$$h(\text{Tom}) < h(\text{Andy}) < h(\text{LeBron}).$$

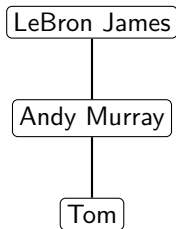

- Define an order $\preceq$ by: $x \preceq y$ iff $h(x) \leq h(y)$.
- This is a chain: every pair has a meet (shorter) and join (taller).

A concrete order: height

- Let $S = \{\text{Tom}, \text{Andy Murray}, \text{LeBron James}\}$.
- Assume heights are strictly ordered:

$$h(\text{Tom}) < h(\text{Andy}) < h(\text{LeBron}).$$

- Define an order $\preceq$ by: $x \preceq y$ iff $h(x) \leq h(y)$.
- This is a chain: every pair has a meet (shorter) and join (taller).

Cumulativity and bounded atoms

Cumulativity

- Assume a way of combining entities: $x + y$ (a sum / merge).

Cumulativity

- Assume a way of combining entities: $x + y$ (a sum / merge).
- Mass nouns are cumulative:

Cumulativity

- Assume a way of combining entities: $x + y$ (a sum / merge).
- Mass nouns are cumulative:

$$water(x) \ \& \ water(y) \Rightarrow water(x + y)$$

Cumulativity

- Assume a way of combining entities: $x + y$ (a sum / merge).
- Mass nouns are cumulative:

$$water(x) \ \& \ water(y) \Rightarrow water(x + y)$$

- Bare plurals are cumulative:

Cumulativity

- Assume a way of combining entities: $x + y$ (a sum / merge).
- Mass nouns are cumulative:

$$water(x) \ \& \ water(y) \Rightarrow water(x + y)$$

- Bare plurals are cumulative:

$$horses(x) \ \& \ horses(y) \Rightarrow horses(x + y)$$

Cumulativity

- Assume a way of combining entities: $x + y$ (a sum / merge).
- Mass nouns are cumulative:

$$water(x) \ \& \ water(y) \Rightarrow water(x + y)$$

- Bare plurals are cumulative:

$$horses(x) \ \& \ horses(y) \Rightarrow horses(x + y)$$

- Singular count nouns are not:

Cumulativity

- Assume a way of combining entities: $x + y$ (a sum / merge).
- Mass nouns are cumulative:

$$\text{water}(x) \ \& \ \text{water}(y) \Rightarrow \text{water}(x + y)$$

- Bare plurals are cumulative:

$$\text{horses}(x) \ \& \ \text{horses}(y) \Rightarrow \text{horses}(x + y)$$

- Singular count nouns are not:

$$\text{horse}(x) \ \& \ \text{horse}(y) \not\Rightarrow \text{horse}(x + y)$$

Horse and horses

- Fix a world w_3 where there are exactly three horses: A, B, C .

Horse and horses

- Fix a world w_3 where there are exactly three horses: A, B, C .
- Then:

$$\llbracket \text{horse} \rrbracket^{w_3} = \{A, B, C\}$$

Horse and horses

- Fix a world w_3 where there are exactly three horses: A, B, C .
- Then:

$$\llbracket \text{horse} \rrbracket^{w_3} = \{A, B, C\}$$

- Allow sums of individuals (e.g. $A + B$).

Horse and horses

- Fix a world w_3 where there are exactly three horses: A, B, C .
- Then:

$$\llbracket \text{horse} \rrbracket^{w_3} = \{A, B, C\}$$

- Allow sums of individuals (e.g. $A + B$).
- Then:

$$\llbracket \text{horses} \rrbracket^{w_3} = \{A+B, A+C, B+C, A+B+C\}$$

Part-of as an order

- Reinterpret $\leq$ as a part-of relation: $x \leq y$ means x is a part of y .

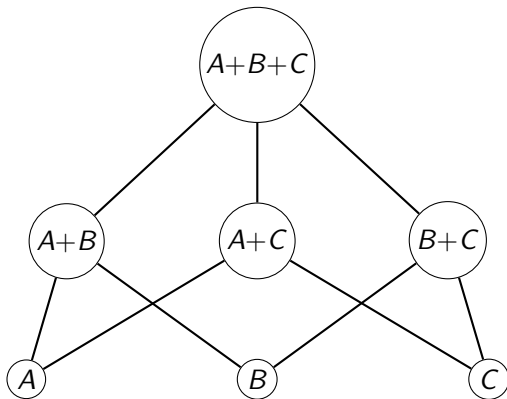

Part-of as an order

- Reinterpret $\leq$ as a part-of relation: $x \leq y$ means x is a part of y .
- The join corresponds to forming sums (so we often write $+$).

Part-of as an order

- Reinterpret $\leq$ as a part-of relation: $x \leq y$ means x is a part of y .
- The join corresponds to forming sums (so we often write $+$).

A part-of lattice for three horses

Bounded atoms and splitting

- Plural: splitting eventually reaches an atom

Bounded atoms and splitting

- Plural: splitting eventually reaches an atom
 - *horses* $\rightsquigarrow$ *a horse*

Bounded atoms and splitting

- Plural: splitting eventually reaches an atom
 - *horses* $\rightsquigarrow$ *a horse*
 - at the bottom: bounded individuals that count as one horse

Bounded atoms and splitting

- Plural: splitting eventually reaches an atom
 - *horses* $\rightsquigarrow$ *a horse*
 - at the bottom: bounded individuals that count as one horse
- Mass: splitting preserves the predicate

Bounded atoms and splitting

- Plural: splitting eventually reaches an atom
 - *horses* $\rightsquigarrow$ *a horse*
 - at the bottom: bounded individuals that count as one horse
- Mass: splitting preserves the predicate
 - subparts of *water* are still *water*

Bounded atoms and splitting

- Plural: splitting eventually reaches an atom
 - *horses* $\rightsquigarrow$ *a horse*
 - at the bottom: bounded individuals that count as one horse
- Mass: splitting preserves the predicate
 - subparts of *water* are still *water*
 - no linguistically privileged “one water” atom

Bounded atoms and splitting

- Plural: splitting eventually reaches an atom
 - *horses* $\rightsquigarrow$ *a horse*
 - at the bottom: bounded individuals that count as one horse
- Mass: splitting preserves the predicate
 - subparts of *water* are still *water*
 - no linguistically privileged “one water” atom
- Count nouns come with bounded atoms; mass nouns do not.

Bounded atoms and splitting

 - *horses* $\rightsquigarrow$ *a horse*
 - at the bottom: bounded individuals that count as one horse
- Mass: splitting preserves the predicate
 - subparts of *water* are still *water*
 - no linguistically privileged “one water” atom
- Count nouns come with bounded atoms; mass nouns do not.

A schematic mass lattice (two parts, ellipsis downward)

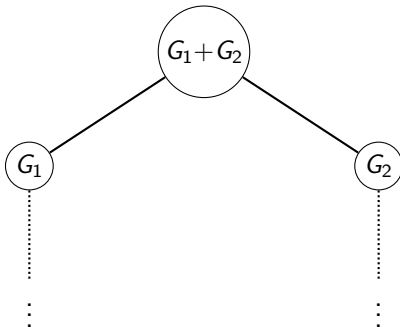

- Under part-of, the join of G_1 and G_2 is their sum $G_1 + G_2$.

A schematic mass lattice (two parts, ellipsis downward)

- Under part-of, the join of G_1 and G_2 is their sum $G_1 + G_2$.
- Unlike count lattices, there is no privileged atomic bottom layer.

A schematic mass lattice (two parts, ellipsis downward)

- Under part-of, the join of G_1 and G_2 is their sum $G_1 + G_2$.
- Unlike count lattices, there is no privileged atomic bottom layer.

Mass nouns with “obvious units”

- Some mass nouns are grammatically mass even though we can easily identify ordinary units.

Mass nouns with “obvious units”

- Some mass nouns are grammatically mass even though we can easily identify ordinary units.
- Example: *furniture*

Mass nouns with “obvious units”

- Some mass nouns are grammatically mass even though we can easily identify ordinary units.
- Example: *furniture*
 - **three furnitures*

Mass nouns with “obvious units”

- Some mass nouns are grammatically mass even though we can easily identify ordinary units.
- Example: *furniture*
 - **three furnitures*
 - *three pieces of furniture*

Mass nouns with “obvious units”

- Some mass nouns are grammatically mass even though we can easily identify ordinary units.
- Example: *furniture*
 - **three furnitures*
 - *three pieces of furniture*
- Having salient real-world units does not automatically mean the grammar provides atomic units for counting.

Mass nouns with “obvious units”

- Some mass nouns are grammatically mass even though we can easily identify ordinary units.
- Example: *furniture*
 - **three furnitures*
 - *three pieces of furniture*
- Having salient real-world units does not automatically mean the grammar provides atomic units for counting.

Grinder and Packager

Universal Grinder

- Many count nouns can be coerced into a mass “stuff” reading.

Universal Grinder

- Many count nouns can be coerced into a mass “stuff” reading.
- Example:

Universal Grinder

- Many count nouns can be coerced into a mass “stuff” reading.
- Example:
 - *There's horse all over the road.*

Universal Grinder

- Many count nouns can be coerced into a mass “stuff” reading.
- Example:
 - *There's horse all over the road.*
- Another way to see the same shift:

Universal Grinder

- Many count nouns can be coerced into a mass “stuff” reading.
- Example:
 - *There's horse all over the road.*
- Another way to see the same shift:
 - termites can eat *book*, but they can't eat *shelf*

Universal Grinder

- Many count nouns can be coerced into a mass “stuff” reading.
- Example:
 - *There's horse all over the road.*
- Another way to see the same shift:
 - termites can eat *book*, but they can't eat *shelf*
 - *book* can be coerced into describing edible material-stuff

Universal Grinder

- Many count nouns can be coerced into a mass “stuff” reading.
- Example:
 - *There's horse all over the road.*
- Another way to see the same shift:
 - termites can eat *book*, but they can't eat *shelf*
 - *book* can be coerced into describing edible material-stuff

Universal Packager

- What could these mean in context?

Universal Packager

- What could these mean in context?
 - *three beers*

Universal Packager

- What could these mean in context?
 - *three beers*
 - *three waters*

Universal Packager

- What could these mean in context?
 - *three beers*
 - *three waters*
 - *two coffees*

Universal Packager

- What could these mean in context?
 - *three beers*
 - *three waters*
 - *two coffees*
 - *three wines*

Universal Packager

- What could these mean in context?
 - *three beers*
 - *three waters*
 - *two coffees*
 - *three wines*
- Try to give at least two distinct readings where possible.

Universal Packager

- What could these mean in context?
 - *three beers*
 - *three waters*
 - *two coffees*
 - *three wines*
- Try to give at least two distinct readings where possible.

Universal Packager

- A mass noun can shift to a count noun by supplying a salient unit:

Universal Packager

- A mass noun can shift to a count noun by supplying a salient unit:
 - **servings:** *three beers* = three glasses/bottles

Universal Packager

- A mass noun can shift to a count noun by supplying a salient unit:
 - **servings:** *three beers* = three glasses/bottles
 - **kinds/types:** *three wines* = three varieties

Universal Packager

- A mass noun can shift to a count noun by supplying a salient unit:
 - **servings:** *three beers* = three glasses/bottles
 - **kinds/types:** *three wines* = three varieties
 - **packaged units:** *two waters* = two bottles

Universal Packager

- A mass noun can shift to a count noun by supplying a salient unit:
 - **servings:** *three beers* = three glasses/bottles
 - **kinds/types:** *three wines* = three varieties
 - **packaged units:** *two waters* = two bottles

Material vs artefact: structure-preserving mappings

Material vs artefact: structure-preserving mappings

Gold and ring

- An artefact and its material can come apart.

Gold and ring

- An artefact and its material can come apart.
 - A ring can be new even if the gold is old.

Gold and ring

- An artefact and its material can come apart.
 - A ring can be new even if the gold is old.
- We can model this with a mapping between domains that preserves part-structure.

Gold and ring

- An artefact and its material can come apart.
 - A ring can be new even if the gold is old.
- We can model this with a mapping between domains that preserves part-structure.

A mapping that preserves sums

- Assume a **ring domain** (rings and their plural sums) and a **gold domain** (gold portions and their sums).

A mapping that preserves sums

- Assume a **ring domain** (rings and their plural sums) and a **gold domain** (gold portions and their sums).
- Introduce a mapping function:

$$mat : \text{Ring} \rightarrow \text{Gold}$$

A mapping that preserves sums

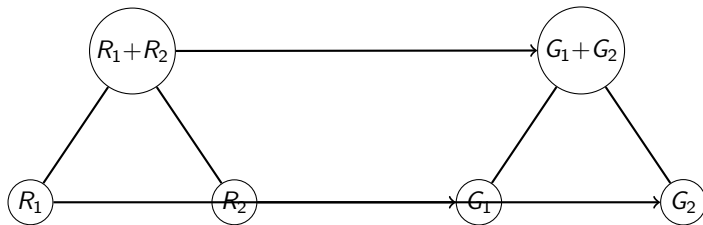

- Assume a **ring domain** (rings and their plural sums) and a **gold domain** (gold portions and their sums).
- Introduce a mapping function:

$$mat : \text{Ring} \rightarrow \text{Gold}$$

- Require sum-preservation:

$$mat(x + y) = mat(x) + mat(y).$$

Diagram: sum-preserving mapping

Summary

Summary

- Count vs mass vs plural reflects deeper structure:

Summary

- Count vs mass vs plural reflects deeper structure:
 - cumulativity (mass and bare plurals),

Summary
