Describing Meaning

Week 5: Determiners, Quantifiers, and Generalised Quantifiers

Dr. Thomas Stephen

School of Linguistic, Speech and Communication Sciences
Trinity College Dublin

Semester 2 2026

Roadmap

Today

- **Where we are:** the last two weeks have focused on **nouns and adjectives** as predicates (sets), including the mass/count/plural contrast.

Today

- **Where we are:** the last two weeks have focused on **nouns and adjectives** as predicates (sets), including the mass/count/plural contrast.
- **Phenomenon:** NPs/DPs can quantify: *every, all, some, no, most, exactly two, fewer than five, ...*

Today

- **Where we are:** the last two weeks have focused on **nouns and adjectives** as predicates (sets), including the mass/count/plural contrast.
- **Phenomenon:** NPs/DPs can quantify: *every, all, some, no, most, exactly two, fewer than five, ...*
- **Formal tools:** predicate logic quantifiers ($\forall, \exists$) and their set-theoretic counterparts (subsethood, intersection, cardinality).

Today

Quantification in predicate logic

From predicates to quantified sentences

- Predicates (Weeks 3–4):

From predicates to quantified sentences

- Predicates (Weeks 3–4):

$$\llbracket hippo \rrbracket = \{x : x \text{ is a hippo}\} \quad \llbracket swim \rrbracket = \{x : x \text{ swims}\}$$

From predicates to quantified sentences

- Predicates (Weeks 3–4):

$$\llbracket hippo \rrbracket = \{x : x \text{ is a hippo}\} \quad \llbracket swim \rrbracket = \{x : x \text{ swims}\}$$

- Simple predication as membership:

From predicates to quantified sentences

- Predicates (Weeks 3–4):

$$\llbracket hippo \rrbracket = \{x : x \text{ is a hippo}\} \quad \llbracket swim \rrbracket = \{x : x \text{ swims}\}$$

- Simple predication as membership:

$$swim(n) \text{ corresponds to } n \in \{x : x \text{ swims}\}$$

From predicates to quantified sentences

- Predicates (Weeks 3–4):

$$\llbracket \textit{hippo} \rrbracket = \{x : x \text{ is a hippo}\} \quad \llbracket \textit{swim} \rrbracket = \{x : x \text{ swims}\}$$

- Simple predication as membership:

$$\textit{swim}(n) \text{ corresponds to } n \in \{x : x \text{ swims}\}$$

- Quantified subjects:

From predicates to quantified sentences

 - *No hippo swam.*

Predicate logic: the basic operators

- $\forall x \varphi$ says: for **each** individual x , φ is true.

Predicate logic: the basic operators

- $\forall x \varphi$ says: for **each** individual x , φ is true.
- $\exists x \varphi$ says: for **some** individual x , φ is true.

Predicate logic: the basic operators

- $\forall x \varphi$ says: for **each** individual x , φ is true.
- $\exists x \varphi$ says: for **some** individual x , φ is true.

Truth conditions

- Fix an interpretation of the predicates (which individuals are hippos, which swam, etc.).

Truth conditions

- Fix an interpretation of the predicates (which individuals are hippos, which swam, etc.).
- Then:

Truth conditions

- Fix an interpretation of the predicates (which individuals are hippos, which swam, etc.).
- Then:
 - $\exists x \varphi(x)$ is true iff there is at least one individual a such that $\varphi(a)$ is true.

Truth conditions

- Fix an interpretation of the predicates (which individuals are hippos, which swam, etc.).
- Then:
 - $\exists x \varphi(x)$ is true iff there is at least one individual a such that $\varphi(a)$ is true.
 - $\forall x \varphi(x)$ is true iff for every individual a , $\varphi(a)$ is true.

Truth conditions

- Fix an interpretation of the predicates (which individuals are hippos, which swam, etc.).
- Then:
 - $\exists x \varphi(x)$ is true iff there is at least one individual a such that $\varphi(a)$ is true.
 - $\forall x \varphi(x)$ is true iff for every individual a , $\varphi(a)$ is true.
- In quantified sentences we typically quantify with a **restriction**.

Truth conditions

- Fix an interpretation of the predicates (which individuals are hippos, which swam, etc.).
- Then:
 - $\exists x \varphi(x)$ is true iff there is at least one individual a such that $\varphi(a)$ is true.
 - $\forall x \varphi(x)$ is true iff for every individual a , $\varphi(a)$ is true.
- In quantified sentences we typically quantify with a **restriction**.

Restriction via implication and conjunction

- *Every hippo swam*

Restriction via implication and conjunction

- *Every hippo swam*

$$\forall x(\textit{hippo}(x) \rightarrow \textit{swim}(x))$$

Restriction via implication and conjunction

- *Every hippo swam*

$$\forall x(\text{hippo}(x) \rightarrow \text{swim}(x))$$

- *Some hippo swam*

Restriction via implication and conjunction

- *Every hippo swam*

$$\forall x(\textit{hippo}(x) \rightarrow \textit{swim}(x))$$

- *Some hippo swam*

$$\exists x(\textit{hippo}(x) \wedge \textit{swim}(x))$$

Restriction via implication and conjunction

- *Every hippo swam*

$$\forall x(\text{hippo}(x) \rightarrow \text{swim}(x))$$

- *Some hippo swam*

$$\exists x(\text{hippo}(x) \wedge \text{swim}(x))$$

- *No hippo swam*

Restriction via implication and conjunction

- *Every hippo swam*

$$\forall x(\text{hippo}(x) \rightarrow \text{swim}(x))$$

- *Some hippo swam*

$$\exists x(\text{hippo}(x) \wedge \text{swim}(x))$$

- *No hippo swam*

$$\neg \exists x(\text{hippo}(x) \wedge \text{swim}(x)) \quad \text{equivalently} \quad \forall x(\text{hippo}(x) \rightarrow \neg \text{swim}(x))$$

Why implication for *every*?

- If there are no hippos, *Every hippo swam* comes out true on

Why implication for *every*?

- If there are no hippos, *Every hippo swam* comes out true on

$$\forall x(\text{hippo}(x) \rightarrow \text{swim}(x))$$

Why implication for *every*?

- If there are no hippos, *Every hippo swam* comes out true on

$$\forall x(\text{hippo}(x) \rightarrow \text{swim}(x))$$

Exercise 1

Translate into predicate logic (use *hippo*(·), *swim*(·), *sleep*(·), *happy*(·)).

- 1 Some hippo swam and slept.

Exercise 1

Translate into predicate logic (use *hippo*(·), *swim*(·), *sleep*(·), *happy*(·)).

- ① Some hippo swam and slept.
- ② No hippo is a happy hippo.

Exercise 1

Translate into predicate logic (use *hippo*(·), *swim*(·), *sleep*(·), *happy*(·)).

- ① Some hippo swam and slept.
- ② No hippo is a happy hippo.
- ③ Every hippo that swam is happy.

Exercise 1

Translate into predicate logic (use *hippo*(·), *swim*(·), *sleep*(·), *happy*(·)).

- ① Some hippo swam and slept.
- ② No hippo is a happy hippo.
- ③ Every hippo that swam is happy.

Why not treat quantified DPs as individuals

Why not treat quantified DPs as individuals

A tempting idea

- You might try to treat a quantified DP as denoting an individual, so that:

A tempting idea

- You might try to treat a quantified DP as denoting an individual, so that:

Every hippo swam looks like *swim(every hippo)*

A tempting idea

- You might try to treat a quantified DP as denoting an individual, so that:

Every hippo swam looks like *swim(every hippo)*

- This encourages postulating special “objects” corresponding to phrases like *every hippo*, *most students*, *no philosophers*, ...

A tempting idea

- You might try to treat a quantified DP as denoting an individual, so that:

Every hippo swam looks like *swim(every hippo)*

- This encourages postulating special “objects” corresponding to phrases like *every hippo*, *most students*, *no philosophers*, ...

Why that semantic move is unattractive

- Quantified DPs do not behave like referential terms: they do not pick out a particular individual to predicate properties of.

Why that semantic move is unattractive

- Quantified DPs do not behave like referential terms: they do not pick out a particular individual to predicate properties of.
- It creates an inflated ontology of special objects whose only role is to make the surface syntax resemble simple predication.

Why that semantic move is unattractive

- Quantified DPs do not behave like referential terms: they do not pick out a particular individual to predicate properties of.
- It creates an inflated ontology of special objects whose only role is to make the surface syntax resemble simple predication.
- It obscures generalisations about inference: we want entailment patterns to follow from set relations, not from stipulations about special objects.

Why that semantic move is unattractive

- Quantified DPs do not behave like referential terms: they do not pick out a particular individual to predicate properties of.
- It creates an inflated ontology of special objects whose only role is to make the surface syntax resemble simple predication.
- It obscures generalisations about inference: we want entailment patterns to follow from set relations, not from stipulations about special objects.
- The last two weeks treated common nouns (and many adjectives) as predicates/sets; quantified DPs naturally combine with predicates by relating two sets.

Why that semantic move is unattractive

Set-theoretic Equivalents

From $\forall, \exists$ to sets

- Let $A = \llbracket hippo \rrbracket$ and $B = \llbracket swim \rrbracket$.

From $\forall, \exists$ to sets

- Let $A = \llbracket hippo \rrbracket$ and $B = \llbracket swim \rrbracket$.
- Then:

From $\forall, \exists$ to sets

- Let $A = \llbracket hippo \rrbracket$ and $B = \llbracket swim \rrbracket$.
- Then:

$\forall x(hippo(x) \rightarrow swim(x))$ is true iff

From $\forall, \exists$ to sets

- Let $A = \llbracket hippo \rrbracket$ and $B = \llbracket swim \rrbracket$.
- Then:

$$\forall x(hippo(x) \rightarrow swim(x)) \text{ is true iff } A \subseteq B$$

From $\forall, \exists$ to sets

- Let $A = \llbracket hippo \rrbracket$ and $B = \llbracket swim \rrbracket$.
- Then:

$\forall x(hippo(x) \rightarrow swim(x))$ is true iff $A \subseteq B$

$\exists x(hippo(x) \wedge swim(x))$ is true iff

From $\forall, \exists$ to sets

- Let $A = \llbracket hippo \rrbracket$ and $B = \llbracket swim \rrbracket$.
- Then:

$\forall x(hippo(x) \rightarrow swim(x))$ is true iff $A \subseteq B$

$\exists x(hippo(x) \wedge swim(x))$ is true iff $A \cap B \neq \emptyset$

Worked example

- Suppose:

Worked example

- Suppose:

$$A = \{a, b, c\} \quad (\text{hippos}) \qquad B = \{a, c\} \quad (\text{swimmers})$$

Worked example

- Suppose:

$$A = \{a, b, c\} \quad (\text{hippos}) \qquad B = \{a, c\} \quad (\text{swimmers})$$

- Then:

Worked example

- Suppose:

$$A = \{a, b, c\} \quad (\text{hippos}) \qquad B = \{a, c\} \quad (\text{swimmers})$$

- Then:

- $A \subseteq B$ is false $\Rightarrow$ *Every hippo swam* is false.

Worked example

- Suppose:

$$A = \{a, b, c\} \quad (\text{hippos}) \qquad B = \{a, c\} \quad (\text{swimmers})$$

- Then:

- $A \subseteq B$ is false $\Rightarrow$ *Every hippo swam* is false.
- $A \cap B = \{a, c\} \neq \emptyset \Rightarrow$ *Some hippo swam* is true.

Worked example

- Suppose:

$$A = \{a, b, c\} \quad (\text{hippos}) \qquad B = \{a, c\} \quad (\text{swimmers})$$

- Then:

- $A \subseteq B$ is false $\Rightarrow$ *Every hippo swam* is false.
- $A \cap B = \{a, c\} \neq \emptyset \Rightarrow$ *Some hippo swam* is true.
- $A \cap B \neq \emptyset \Rightarrow$ *No hippo swam* is false.

Worked example

- Suppose:

$$A = \{a, b, c\} \quad (\text{hippos}) \qquad B = \{a, c\} \quad (\text{swimmers})$$

- Then:

- $A \subseteq B$ is false $\Rightarrow$ *Every hippo swam* is false.
- $A \cap B = \{a, c\} \neq \emptyset \Rightarrow$ *Some hippo swam* is true.
- $A \cap B \neq \emptyset \Rightarrow$ *No hippo swam* is false.

Quantified expressions and syntax

Quantified expressions

- Examples:

Quantified expressions

- Examples:
 - *every hippo, all hippos*

Quantified expressions

- Examples:
 - *every hippo, all hippos*
 - *some hippo, no hippos*

Quantified expressions

- Examples:
 - *every hippo, all hippos*
 - *some hippo, no hippos*
 - *most hippos*

Quantified expressions

- Examples:
 - *every hippo, all hippos*
 - *some hippo, no hippos*
 - *most hippos*
 - *exactly two hippos, at least three hippos, fewer than five hippos*

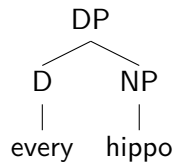

Quantified expressions

- Examples:
 - *every hippo, all hippos*
 - *some hippo, no hippos*
 - *most hippos*
 - *exactly two hippos, at least three hippos, fewer than five hippos*
- Syntactically, these are DPs with a determiner-like element plus an NP.

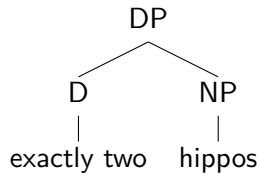

Quantified expressions

- Examples:
 - *every hippo, all hippos*
 - *some hippo, no hippos*
 - *most hippos*
 - *exactly two hippos, at least three hippos, fewer than five hippos*
- Syntactically, these are DPs with a determiner-like element plus an NP.

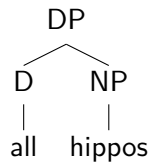

Tree 1: *every hippo*

Tree 2: *exactly two hippos*

Tree 3: *all hippos*

Before generalised quantifiers

Before generalised quantifiers

A quick bit of history

- Frege gave the modern idea of quantifiers as operators binding variables.

A quick bit of history

- Frege gave the modern idea of quantifiers as operators binding variables.
- Mid-20th century logic made precise the connection between quantification and set relations.

A quick bit of history

- Frege gave the modern idea of quantifiers as operators binding variables.
- Mid-20th century logic made precise the connection between quantification and set relations.
- A major move in formal semantics was to treat natural language determiners as denoting **relations between sets**.

A quick bit of history

- Frege gave the modern idea of quantifiers as operators binding variables.
- Mid-20th century logic made precise the connection between quantification and set relations.
- A major move in formal semantics was to treat natural language determiners as denoting **relations between sets**.
- This makes it straightforward to treat *most*, *exactly two*, *infinitely many*, and other determiners on a par with *every* and *some*.

A quick bit of history

- Frege gave the modern idea of quantifiers as operators binding variables.
- Mid-20th century logic made precise the connection between quantification and set relations.
- A major move in formal semantics was to treat natural language determiners as denoting **relations between sets**.
- This makes it straightforward to treat *most*, *exactly two*, *infinitely many*, and other determiners on a par with *every* and *some*.

Generalised quantifiers

Generalised quantifiers as sets of sets

- A predicate (like *swim*) denotes a set of individuals B .

Generalised quantifiers as sets of sets

- A predicate (like *swim*) denotes a set of individuals B .
- A generalised quantifier denotes a **set of such sets**.

Generalised quantifiers as sets of sets

- A predicate (like *swim*) denotes a set of individuals B .
- A generalised quantifier denotes a **set of such sets**.
- Example idea: fix the restrictor set $A = \llbracket \textit{hippo} \rrbracket$. Then:

Generalised quantifiers as sets of sets

- A predicate (like *swim*) denotes a set of individuals B .
- A generalised quantifier denotes a **set of such sets**.
- Example idea: fix the restrictor set $A = \llbracket \textit{hippo} \rrbracket$. Then:
 - *Every hippo* corresponds to the collection of sets B such that $A \subseteq B$.

Generalised quantifiers as sets of sets

- A predicate (like *swim*) denotes a set of individuals B .
- A generalised quantifier denotes a **set of such sets**.
- Example idea: fix the restrictor set $A = \llbracket \textit{hippo} \rrbracket$. Then:
 - *Every hippo* corresponds to the collection of sets B such that $A \subseteq B$.
 - *Some hippo* corresponds to the collection of sets B such that $A \cap B \neq \emptyset$.

Generalised quantifiers as sets of sets

- A predicate (like *swim*) denotes a set of individuals B .
- A generalised quantifier denotes a **set of such sets**.
- Example idea: fix the restrictor set $A = \llbracket \textit{hippo} \rrbracket$. Then:
 - *Every hippo* corresponds to the collection of sets B such that $A \subseteq B$.
 - *Some hippo* corresponds to the collection of sets B such that $A \cap B \neq \emptyset$.
- Determiners can be represented by a condition $DET(A)(B)$ on the pair of sets (A, B) .

Generalised quantifiers as sets of sets

- A predicate (like *swim*) denotes a set of individuals B .
- A generalised quantifier denotes a **set of such sets**.
- Example idea: fix the restrictor set $A = \llbracket \textit{hippo} \rrbracket$. Then:
 - *Every hippo* corresponds to the collection of sets B such that $A \subseteq B$.
 - *Some hippo* corresponds to the collection of sets B such that $A \cap B \neq \emptyset$.
- Determiners can be represented by a condition $DET(A)(B)$ on the pair of sets (A, B) .

Determiners as relations between sets

Determiners as relations between sets

Restrictor and scope

- In *DET N VP*:

Restrictor and scope

- In *DET N VP*:
 - the noun denotes a set A (restrictor),

Restrictor and scope

- In *DET N VP*:
 - the noun denotes a set A (restrictor),
 - the VP denotes a set B (scope predicate).

Restrictor and scope

- In *DET N VP*:
 - the noun denotes a set A (restrictor),
 - the VP denotes a set B (scope predicate).
- Determiner meanings can be stated as conditions on A and B .

Restrictor and scope

- In *DET N VP*:
 - the noun denotes a set A (restrictor),
 - the VP denotes a set B (scope predicate).
- Determiner meanings can be stated as conditions on A and B .

Set-theoretic descriptions

Let A be the noun set and B the VP set.

- $\llbracket \text{every} \rrbracket(A)(B) = [A \subseteq B]$

Set-theoretic descriptions

Let A be the noun set and B the VP set.

- $\llbracket \text{every} \rrbracket(A)(B) = [A \subseteq B]$
- $\llbracket \text{all} \rrbracket(A)(B) = [A \subseteq B]$

Set-theoretic descriptions

Let A be the noun set and B the VP set.

- $\llbracket \text{every} \rrbracket(A)(B) = [A \subseteq B]$
- $\llbracket \text{all} \rrbracket(A)(B) = [A \subseteq B]$

Set-theoretic descriptions

Let A be the noun set and B the VP set.
